Dear Alvin:

Thank you for your introduction to Enviro-Save Products.. We are really impressed with the results that we have gotten through decreased wear in the gear boxes and components of the TTS Delta Powered Disc Trenchers that we operate to scarify logged ground for replanting.

The trenchers are operated in some very tough and rough conditions. Usually the drive shafts must be changed every 200 to 400 hours. The gear boxes usually last one season. Our experience has shown that with Enviro-Save we can get up to 800 hours on the drive shafts and two years from the gear boxes.

We also treated our John Deere 740 grapple skidders which are equipped with 44 inch flotation tires and are used as the prime movers for the powered disc trenchers. Experience on the machine shows that we can expect double the time of running before wear begins to show. Fuel consumption has also decreased since using your product, by an average of 10 percent.

We continually get salesmen with "miracle" compounds coming by to try to get us to use them. Nothing has worked like Enviro-Save.

For us to be writing a letter of testimonial is really something. But then again, your product has proven itself to us. Everything that runs on our place has been treated with Enviro-Save because we believe that the savings from the decreased wear more than pays for the product many times over.

Sincerely,

Iva and Wayne Tuttle
